RFOptic's analog RFoF compact modules enable long-distance transport of wideband RF signals. The Tx unit uses an optical transmitter, converts wideband RF signals to an Optical signal and the Rx unit converts the Optical signal back to the RF signal. The two units are connected by the customer's fiber.

In general, a wide range of spurious-free dynamic range (SFDR) is desirable when multiple signals of very different power levels are expected. This Low Noise RFoF HSFDR link offers improved Noise Figure performance. High SFDR transmission RFoF simplifies signal conditioning requirements intended to avoid signal saturation and subsequent consequences such as power level adjustment. During e.g., antenna testing, radar, or communications system testing, high SFDR is essential due to the typical large amplitude ratios between main and side lobes or close and distant targets. The same applies to DF/ELINT systems that have to handle strong jammers concurrent with weak signals of interest.

RFOptic's 12, 18, 20, 30, 40, and 67GHz RFoF solutions provide high SFDR of minimum 111 dB/Hz. Due to their improved NF, an additional pre-amplifier may not be needed. These high performance products are used in applications such as civil communication, antenna remoting, telemetry, defense systems, satellite communications, and more.

[1] Extended low frequency 0.1-67 GHz is optional.
[2] Excluding customer fiber loss.
[3] Measured at mid-band (35GHz) see plot for details. Gain, P1dB, and typical NF values for RFoF HSFDR with Pre/Post Amps depend on the application.
[4] Excluding in-band harmonics. SFDR (calculated) $\approx$ 2/3x[(IP1dB+10)+174-NF] dB/Hz$^{2/3}$.
[5] Spur levels of the link without Pre/Post amplifiers. Spur levels with a 17dB pre-amplifier is under -90dBm. Spur levels with a 17dB post-amplifier is about -78dBm, and with a 30dB post-amplifier to about -65dBm. Each amplifier adds about ±1.5dB to the gain flatness and about 3.5W to the module power consumption.
[6] See table on page 3 for RFoF enclosure options.
